

Connect a wire to the distribution box

AI Overview

To connect wires to a distribution box safely, first turn off the main power, mount the box securely, connect the incoming live, neutral, and ground wires to the main terminals, attach circuit breakers, and then wire the outgoing circuits according to the load.

Step-by-Step Connection Process

1. Safety First Always ensure the main power supply is completely turned off before starting any work. Use an electrical tester to confirm there is no live current. Wear personal protective equipment such as insulating gloves, safety glasses, and slip-resistant shoes to prevent electric shock or injury . 2. Mount the Distribution Box Mark the installation location and drill holes for mounting. Fix the box securely using expansion bolts or screws, ensuring it is level and stable. For outdoor installations, use a waterproof box and add a rain cover to prevent water ingress . 3. Prepare the Wires Strip the insulation from the ends of the wires to the appropriate length. Ensure the exposed conductor is neither too long nor too short to avoid short circuits or poor contact. Organize wires neatly and use zip ties to prevent tangling . 4. Connect Incoming Power

- Phase (Live) Wire: Connect the incoming live wire (usually brown or red) to the main terminal or main MCB input .
- Neutral Wire: Connect the neutral wire to the neutral link.
