

How many channels does fiber optic audio transmission have

Overview

SPDIF carries 2 channels (stereo), while optical can carry up to 8 channels (compressed surround sound) to enjoy your surround sound movies. Fiber optic cables transmit data as light signals through thin strands of glass or plastic fibers. These fibers are fragile, almost the diameter of a human hair, yet they can carry vast amounts of data and transmit it at incredible speeds. Fiber is preferred. MADI is a powerful multi-channel digital audio transmission standard widely used in live sound, broadcast, and studio environments for sending multiple channels of audio between devices like audio interfaces, mixing consoles, stage boxes, AD/DA converters and microphone preamps.
