

How to disconnect a router from fiber optic cable

AI Overview

To safely disconnect a fiber optic cable from your router, power down the device, identify the connector type, and gently release it without bending or twisting the cable.

Safety Precautions

Fiber optic cables transmit data as light through extremely thin glass fibers, which are fragile and can be damaged easily. The light signal may be invisible infrared, which can harm your eyes if viewed directly, so never look into the cable end or port while it is active . Always power down the router or modem before handling the cable to eliminate electrical hazards and deactivate the light signal . Keep your workspace clean to prevent dust or debris from contaminating the fiber ends .

Identify the Connector Type

Common residential fiber connectors include SC, LC, ST, and FC. SC connectors are square and use a push-pull mechanism, while LC connectors are smaller and often have a clip or latch. Knowing the connector type helps you release it properly without applying excessive force .

Step-by-Step Disconnection

- **Power Down Devices:** Turn off the router, modem, or any connected fiber equipment .
- **Stabilize the Device:** Hold the router or modem steady with one hand to prevent movement while disconnecting the cable .
