

How to run the cables out of the distribution box

AI Overview

Cables should be routed from the right side of the distribution box, organized neatly, and secured with ties to ensure safety and compliance.

Step-by-Step Guide

1. Plan the Wiring Path Before running cables, determine the destination of each circuit and the appropriate wire gauge based on load requirements. Lighting and socket circuits typically use 2.5mm² wires, while air conditioning or high-power circuits may require 4.0mm² wires . 2. Identify Wiring Direction In most distribution boxes, wiring between the main circuit breaker and branch breakers is routed on the left, while wires exiting the box are routed on the right . This ensures a clean and organized layout. 3. Connect to Breakers

- Connect the phase (live) wire to the input terminal of the breaker.
- Connect the neutral wire to the neutral busbar.
- Connect the earth wire to the earth busbar.
- For double-pole MCBs, connect both phase and neutral from the RCCB output to the MCB input . 4. Organize and Secure Cables
- Bundle wires using plastic ties, keeping spacing uniform and wires straight .
- Avoid sharp bends and ensure cables are not under tension.
- Label each cable for easy identification and future maintenance . 5. Safety Checks
