

How to test a fiber optic coupler

Overview

Perform a visual inspection of the coupler and fiber adapter to check for any visible defects, such as scratches, cracks, or contamination. Testing a splitter or other passive fiber optic devices like switches is little different from testing a patchcord or cable plant using the two industry standard tests, OFSTP-14 for double-ended loss (connectors on both ends) or FOTP-171 for single-ended testing. This note also provides background information on system link configurations, test equipment and system component considerations that influence. This is your "QuickStart" guide to testing fiber optic cable plants, patchcords and communications equipment with a fiber optic light source and power meter. We'll give you the basic information you need and provide some printable references. Continuity testing verifies that the fiber is intact and that light can pass through from one end to the other without any blockages.
