

KVM Switch Network Cable Connection

AI Overview

A KVM switch connects multiple computers to a single keyboard, monitor, and mouse using video, USB, and sometimes network cables, allowing seamless control and switching between systems.

Understanding KVM Connections

A KVM (Keyboard, Video, Mouse) switch allows you to control multiple computers from a single set of peripherals. The connection setup typically involves three main types of cables:

- Video cables: HDMI, DVI, VGA, or DisplayPort cables connect each computer's video output to the KVM switch to transmit display signals .
- USB cables: These connect the keyboard and mouse from the KVM switch to each computer, enabling input control .
- Audio or network cables (optional): Some advanced KVM switches support audio or remote network access, which may require Ethernet or specialized network cables .

Step-by-Step Connection

- Identify ports: Check the KVM switch for the number and type of ports (HDMI, VGA, USB, Ethernet) and ensure your computers have compatible outputs .
- Connect video: Use the appropriate video cable from each computer's video output to the corresponding KVM switch port. Ensure cable standards match (e.g., HDMI 2.0 for high-resolution displays) to avoid quality loss .
- Connect USB: Plug USB cables from the KVM switch to each computer to handle keyboard and mouse signals .
