

Optical Module Screws

AI Overview

Optical modules use a variety of screws, including M2/M3 drive screws, miniature adjustment screws, and precision ball screws for alignment and mounting.

Optical Drive and Mounting Screws

For mounting optical drives or components in devices, M3 screws (3mm diameter, 0.5mm pitch) are commonly used, often in lengths from 1 to 20mm depending on the material thickness. Some systems also use #4-40 screws as an alternative. These screws typically have hex, pan, or thumb heads for easy installation and secure fastening, and are suitable for thin materials like drive casings or acrylic panels. For NVMe drives, M2x0.4 screws are standard, while 2.5" HDDs use M3x4mm, and 3.5" HDDs use 6-32 screws.

Miniature Adjustment Screws for Optomechanics

Optical modules often require fine-threaded adjustment screws to precisely align lenses, mirrors, or fiber optics. These screws are usually made from stainless steel with brass sleeves to provide smooth, stable movement and long-term durability. They allow minute positional changes critical for optimizing optical performance and can be sourced from manufacturers like Thorlabs or custom-made to meet specific tolerances.
