

Power Distribution Box for Computer Room

AI Overview

Power Distribution Units (PDUs) are essential for safely and efficiently distributing electricity to servers, networking devices, and other critical IT equipment in computer rooms and data centers.

Overview

A Power Distribution Unit (PDU) is a centralized device that distributes electrical power to multiple devices within a server rack or computer room. PDUs ensure reliable power delivery, protect equipment, and can include features for monitoring and control. They are available in basic, metered, monitored, and intelligent (switched) models, depending on the level of control and visibility required .

Types of PDUs

- Basic PDUs: Provide simple, reliable power distribution without monitoring or switching capabilities. Ideal for environments where power management is not critical .
- Metered PDUs: Include a local display to monitor real-time power usage, helping prevent overloads and optimize energy efficiency .
- Monitored PDUs: Allow remote monitoring of power consumption via network interfaces, providing visibility into rack-level energy usage .
- Switched/Intelligent PDUs: Enable remote control of individual outlets, allowing administrators to power cycle devices, schedule shutdowns, and manage energy usage per outlet .
